Affinity Diagram – Work Assigned

Image scanner to calendar

Take photos of assigments and their date, they will be added on that date with the image of the assigment

Will need an API for an AI image scanner to get the text and dates

If the date is not included it will have to be input manually

If the assignment has a link, doc, vid, etc, you will still have to go find it

Site to scan for new HW

Will have to understand when new work is added to each site

Will need to independently access each site where work is uploaded

If new work is uploeaded will have to take a photo and upload it to the site

Level of autonomsy required is terrifying

Moblie app with images from each site with HW

Will need to independently access each site where work is uploaded

Will have to understand what is new/old work

Will have to take images of new work and upload it to the app

Would probably need a database to hold all the info of old HW to reference

Email whenever new HW is added

Will need someway to store emails sent to check if it has sent an assignment already

Will need to access each site

Very streamline as each email can include an image of the new assignment and a link to it

Would be cluttered with other emails throughout the day

Notifications with links with new HW

Would need someway to send notifications to your phone

Will need someway to store assignments sent to check if it has sent an assignment already

The notification can link to the assignment for easy access

Would not be able to store the assignments so you could forget about them
